

Product Requirements Document (PRD)

Product Name: COURT PULSE Document

Version: 1.0 (Lean / Grassroots Launch)

Author: Product Lead & Co-Founders Target
Launch: Phase 1 V1.0 (Lagos State Pilot –
Independent Rollout)

1. Executive Summary & Strategy Shift

[1.1](#) Strategic Intent

COURT PULSE V1.0 will launch independently of official government e-filing API integrations to bypass administrative bureaucracy and achieve rapid time-to-market. By leveraging Crowdsourced Intelligence ("Waze for Courts"), Self-Serve Case Watchlists with OCR Scanning, and Direct Registrar Onboarding, the platform

will deliver immediate, high-accuracy value to litigators on Day 1.

Once critical mass (5,000+ active litigators) is achieved, this user base will serve as leverage to secure formal government e-filing integration approvals for future versions.

2. User Roles & Access Hierarchy

User Role	Onboarding Mechanism	Primary Objective
Litigating Lawyer	Self-registration via Supreme Court Enrolment Number + Phone OTP	Track personal case watchlists, receive real-time crowdsource d/registrar

		alerts, post "Spotter" status, request/offer brief holding.
Court Registrar / Clerk	Direct email invitation / Admin verification	Post official court sitting status, manage live Virtual Dock, approve remote date requests.
System Admin	Secure Internal Authentication	Manage verification algorithms, dispute resolution, and escrow

		payment processing.
--	--	------------------------

3. Core V1.0 Feature Requirements (Strategies 1–3)

Module 1: Self-Serve Case Watchlist & AI Cause List Scanner (Strategy 3)

Case Entry Engine: Lawyers manually add their active matters to a personal "Watchlist" by specifying: *Judicial Division, Court Room, Suit Number, and Scheduled Date.*

AI Cause List OCR:

Any user (lawyer or registrar) can snap a photo of a physical cause list posted outside a courtroom.

Integrated Optical Character Recognition (OCR) software extracts suit numbers,

lawyer names, and matter details from the image.

System automatically cross-references extracted suit numbers with all user watchlists and sends a notification matching cases: *"Your matter [Suit No.] is listed as Item #7 on today's cause list."*

Module 2: Crowdsourced Verification Engine – "Waze for Courts" (Strategy 1)

Lawyer Spotter Check-In: Checked-in lawyers physically present in a courtroom can submit 1-tap micro-status updates:

Court Not Sitting | Sitting Late | Judge on Bench | Court in Recess.

Multi-Point Consensus Algorithm:

A status change reported by 1 user is marked as *Unverified*.

When 2 or 3 independent users in the

same courtroom submit the same status, the system promotes the status to **Verified**.

Automated push alerts (SMS, WhatsApp, Push Notifications) are immediately dispatched to every lawyer tracking cases in that courtroom.

Gamification & Incentive System: Spotters earn "Pulse Credits" for submitting early, verified reports. Credits can be redeemed for fee discounts in the Brief-Holding Marketplace or free premium analytics.

Module 3: Grassroots Registrar Web Portal (Strategy 2)

Zero-Friction Registrar Interface: A lightweight, mobile-responsive web dashboard accessible via phone browsers without requiring complex software

installations.

1-Tap Status Updates: Onboarded registrars can update courtroom availability in seconds (Not Sitting, Sitting Late, On Bench).

Direct Broadcasts: Registrars can post urgent announcements (e.g., "*Court 3 sitting suspended until [11:30 AM](#) due to chamber meeting*"), triggering immediate multi-channel alerts to counsel tracking cases in that division.

Module 4: "Next-Door Counsel" (Brief-Holding Marketplace)

Request Engine: Counsel unable to attend court can post a brief-holding request restricted to routine administrative matters (*Adjournment, Mention, Date Taking*).

Geo-Fenced Alerts: The request is broadcast only to verified, checked-in lawyers currently

inside that specific court complex.

Escrow & Execution: Requesting counsel deposits the agreed fee into an in-app escrow wallet. Upon completion of the court session, the standing-in lawyer uploads session notes, and funds are automatically released.

Module 5: Virtual Dock & Remote Date-Taking Hub

Live Order of Business Tracker: Displays active matter updates updated by the Registrar or verified by crowd spotters (e.g., *"Currently calling Item #4"*).

Remote Date Picker: If a court status is verified as *Not Sitting*, counsel can select mutually agreeable future dates directly through the platform for Registrar confirmation.

4. Technical Architecture (Independent Stack)

[User App / Web] ---> [OCR Engine] --->
[Consensus Algorithm] ---> [Real-time Database]
| V [Push / WhatsApp / SMS API]

Frontend: React Native (Cross-platform iOS/Android mobile app) + Web Application for Registrars.

Backend: Node.js / Python (FastAPI)
microservices running on AWS or Google Cloud Platform.

OCR Engine: Tesseract OCR / Google Cloud Vision API for processing cause list photographs.

Messaging Gateways: Twilio / Termii API integration for instant WhatsApp and SMS alert dispatch.

5. Non-Functional Requirements

Latency: Crowdsourced alerts must be processed and verified within ≤ 15 text{ seconds} of consensus.

OCR Processing Time: Image-to-text processing and case matching must complete within ≤ 30 text{ seconds} of photo upload.

Data Security: Strict adherence to data privacy standards (NDPR); lawyer contacts and fee escrow balances are fully encrypted.

6. Success Metrics & Validation Strategy

Traction Goal: Onboard 2,500 active litigators and 20 court registrars across Lagos State within 90 days of release.

Verification Accuracy: \ge 95\% accuracy rate on crowdsourced status updates.

Platform Engagement: Daily Active Users (DAU) ratio during morning court hours ([7:30 AM](#) – [10:30 AM](#) WAT).

Conversion Milestone: Leverage verified usage data to submit a formal pitch to the Lagos State Judiciary for direct e-filing integration.
